Two new salts of the cation [CuI(dmp)₂]+ (dmp is 2,9-dimethyl-1,10-phenanthroline, C₁₄H₁₂N₂), namely bis[bis(2,9-dimethyl-1,10-phenanthroline-2,N₀,N₀)]copper(I) bis(hexafluorophosphate) hemi[bis(4-pyridylmethylidene)hydrazine] acetonitrile solvate, [Cu(C₁₄H₁₂N₂)₂](PF₆)₂·0.5C₁₂H₁₀N₄C₂H₃No r or [Cu(dmp)₂](PF₆)₂·0.5(bpmh)-CH₃CN, (I), and bis(2,9-dimethyl-1,10-phenanthroline-κ²N,N₀)copper(I) dicyanamide, [Cu(C₁₄H₁₂N₂)₂](C₂N₃) or [Cu(dmp)₂][N(CN)₂], (II), are reported. The Cu–N bond lengths and the distortion from idealized tetrahedral geometry of the dmp ligands are discussed and compared with related compounds. The bpmh molecule in (I) is ²π—π stacked with a dmp ligand at a distance of 3.4 Å, rather than coordinated to the metal atom. The molecule lies across an inversion center in the crystal. In (II), the normally coordinated dicyanamide molecule is present as an uncoordinated counter-ion.

Comment

Complexes of copper chelated with 2,9-dimethyl-1,10-phenanthroline (dmp) have attracted attention due to their long-lived excited states and potential use in solar energy conversion (Blake et al., 1998; Kuang et al., 2002; Chen et al., 2002; Morpurgo et al., 1984; Cuttell et al., 2002). Such compounds absorb light in the visible range to undergo a metal-to-ligand charge transfer (MLCT). Upon excitation, the molecules are known to undergo a geometry change, and this change has been observed in one such compound through time-resolved X-ray diffraction (Coppens et al., 2004). Kovalevsky et al. (2003, 2004) have recently reported on a series of [CuI(dmp)₂]+ salts with varying counter-ions in an attempt to correlate the ground-state structure and spectroscopic properties. Much attention has been focused on the distortion of the [CuI(dmp)₂]+ cation from its idealized tetrahedral geometry. Understanding the effects of packing forces on the geometry of the cation is a necessary preliminary step for understanding the geometry changes associated with photoexcitation. We report here the crystal structures of two new [CuI(dmp)₂]+ compounds.

Crystals of [Cu(dmp)₂](PF₆)₂·0.5(bpmh)-CH₃CN, (I) (Figs. 1 and 2), contain two [CuI(dmp)₂]+ cations, two PF₆⁻ anions, one acetonitrile solvent molecule, and one half-molecule of bpmh (residing on an inversion center) in the asymmetric unit. All bond lengths and angles are within their expected ranges. Two F atoms of one of the PF₆⁻ anions are disordered. The pyridyl ring (N₉/C₅₋_-O₆) of the bpmh ligand at (x, y, z) is almost coplanar with the dmp N₇/C₄₋₋C₄₆/C₅₄ ring and stabilized by ²π—π stacking; the centroid–centroid separation is 3.62 Å and the shortest atom–atom separation is 3.263 (2) Å (C₆₀₋₋C₄₅). Dmp rings C₁₈₋₋C₂₁/C₂₅/C₂₆ at (x, y, z) and (−x, −y, −z) are separated by 3.378 (1) Å, with a shortest atom–atom separation of 3.360 (2) Å (C₁₉₋₋C₂₅).

Crystals of (I) (Figs. 1 and 2) were prepared in an attempt to link the two Cu atoms through a bpmh linkage. While the bpmh molecule has often been utilized as a linker in the metal-organic compounds

construction of supramolecular frameworks (Ma & Coppens, 2003) and in metal polymers (Ag, Co, Mn, Ni, Pb, Zn), to date no examples of a Cu complex with a bridging bpmh are known. Several examples of Cu compounds with similar bridging ligands, but containing a heterocyclic five-membered ring rather than the dimethylhydrazine group, are known (Du et al., 2002, 2004; Dong et al., 2003; Huang et al., 2004). Even though an excess of the ligand was used during the synthesis of (I), the bpmh was incorporated into the crystal in an uncoordinated arrangement. Goodgame et al. (2001) reported another crystal in which a molecule which usually acts as a linker, namely 1-(4-pyridyl)pyridin-4-one, co-crystallizes in a Cu complex instead. Kovalevsky et al. (2003) reported an example in which an uncoordinated dmp molecule is π–π stacked with a coordinated dmp ligand.

The rocking, wagging, and flattening distortions of the cations were calculated using a method described previously by Dobson et al. (1984). For cation A, the flattening distortion is rather large at θz = 79.6°, whereas the rocking and wagging distortions are θx = 87.8° and θy = 84.7°, respectively. Cation B has slightly larger rocking and wagging distortions of θx = 84.6° and θy = 84.2°, respectively, and a smaller flattening of θz = 81.3°. Kovalevsky et al. (2003, 2004) have reported two other hexafluorophosphate salts of this cation, one of which crystallizes with a 0.5-occupancy CH₂Cl₂ solvent molecule. The cations in the crystals of both these compounds are considerably more distorted than cations A or B in (I). The overall distortion of the cations in (I) is nearly the same and in the middle of the range of all previously reported salts of this cation (Kovalevsky et al., 2003). In cation A, the Cu–N distances range from 2.026 (1) to 2.060 (1) Å; cation B has a similar Cu–N distance range of 2.018 (1)–2.059 (1) Å.

Compound (II) (Fig. 3), [Cu(dmp)₂][N(CN)₂], crystallizes with one [Cu{dmp}₁]⁺ cation and one [N(CN)₂]⁻ anion in the asymmetric unit. All bond lengths and angles lie within their expected ranges. The Cu–N bond length range is 2.019 (1)–2.050 (1) Å. The rocking and wagging distortions in the cation are θx = 88.2° and θy = 86.9°, with a flattening of θz = 88.6°. The overall distortion of the cation is quite small and comparable with that of the least distorted salt reported to date, with a p-tosylate counter-ion (Kovalevsky et al., 2003). The C4–C7/C11/C12 ring is parallel to the inversion-related ring at (2 – x, – y, – z), with a centroid–centroid separation of 3.50 Å.

The [N(CN)₂]⁻ ion (dca) is a much-used ligand in Cu coordination chemistry. It has attracted recent attention because of its multiple coordination modes and interesting magnetic properties (Vangdal et al., 2002). However, it is rarely found as an uncoordinated counterion. Two cases have been reported to date. In the first, the dca anion is semi-coordinated in [Cu₂(tppz)(dca)₃(H₂O)]·[dca]·H₂O [tppz is 2,3,5,6-tetrakis(2-pyridyl)pyrazine], with N–Cu 2.939 Å (Carranza et al., 2003). However, in (II) the dca anion is completely uncoordinated, the shortest Cu–N distance being 4.641 Å. In the second case, dca is linked to a cation via an N–H···N hydrogen bond in the salt [Cu(C₂N₃)(trien)][C₆N₃] (Luo et al., 2003). In (II), only weaker C–H···N interactions exist, the shortest being 0.2 Å longer than the N–H···N bond linking the cation and anion in the compound prepared by Luo et al. The previously reported compounds also contain at least one coordinated dca anion. In (II), all dca atoms are coplanar, whereas the central C–N–C bond angle is 117.74 (14)°. The two terminal C–N bonds are bent slightly outwards, with N–C–N angles of 174.36 (17) and 175.3 (2)°.

**Experimental**

In attempting to synthesize polymeric copper(I)–dmp complexes, we found that [Cu(dmp)₂] will often form even when it is not favored by the stoichiometry. Compound (I) was synthesized by dissolving [Cu(CH₃CN)₄]PF₆ (1.0 mmol), dmp (0.9 mmol), and bpmh (1.3 mmol) in CH₂Cl₂ (30 ml) and CH₃CN (20 ml). The bright-red solution was heated to 343 K and stirred for 3 h. The solid remaining
metal-organic compounds

after the reaction was filtered off. Dark-red crystals were obtained by gas-phase ether diffusion into the solution. Compound (II) was synthesized by dissolving CuCl (1.0 mmol), dmp (0.9 mmol), and NaN(CN)2 (1.3 mmol) in ethanol (15 ml) and water (15 ml). The orange solution was stirred and heated to 343 K for 3 h. Orange crystals were grown by slow evaporation of the solution.

H atoms were located in difference maps and treated as riding for the aromatic and methylene H atoms, with C–H distances of 0.95 Å and with \( U_{	ext{iso}}(H) = 1.2U_{	ext{eq}}(C) \), and placed in idealized positions for CH3 H atoms, with C–H distances of 0.98 Å and with \( U_{	ext{iso}}(H) = 1.5U_{	ext{eq}}(C) \). Free isotropic refinement of H atoms did not lead to a significant improvement in the R factor.

For both compounds, data collection: SMART (Bruker, 1999); cell refinement: SMART; data reduction: SAINT (Bruker, 1999); structure solution: SHELXS97 (Sheldrick, 1997); structure refinement: SHELXL97 (Sheldrick, 1997); molecular graphics: SHELXTL (Bruker, 1997); publication software: SHELXTL.

Financial support of this work by the National Science Foundation (grant No. CHE0236317) is gratefully acknowledged.
